TEMPERATURE RANGE FOR FRONIUS SNAPINVERTER INCLUDING DATAMANAGER 2.0 IN USA AND CANADA

Fronius International GmbH

provides a portfolio of Photovoltaic Inverters designed for ambient temperatures down to -40°C. This inverters are equipped with the communication card Datamanager 2.0 by default. It is also possible to buy a light version of the inverter without communication card e.g. for big installations with more inverters. In this case it is common to use light versions of the inverters and an additional Datamanager 2.0 card which is built-in by the installer on the construction site.

The Datamanager Card 2.0 is rated with -20°C only. Inside a Fronius Inverter with a temperature range down to -40°C Fronius grants the full operation of the Datamanager 2.0 also down to -40°C.
